$f_S(X^{(S)}; \theta^{(S)})$

DHA: Objective Function

- **We want to optimize following function:**

$$\min_{\mathbf{G}, \mathbf{R}^{(i)}, \theta^{(i)}} \sum_{i=1}^{S} \left\| \mathbf{G} - f_i\left(\mathbf{X}^{(i)}; \theta^{(i)}\right) \mathbf{R}^{(i)} \right\|_F^2 \qquad \textbf{s.t.} \quad \mathbf{G}^\top \mathbf{G} = \mathbf{I}$$

$$\mathbf{G} = \frac{1}{S} \sum_{j=1}^{S} f_j\left(\mathbf{X}^{(j)}; \theta^{(j)}\right) \mathbf{R}^{(j)}$$

where the deep network is defined as follows:

$$f_\ell\left(\mathbf{X}^{(\ell)}; \theta^{(\ell)}\right) = \textbf{mat}\left(\mathbf{h}_C^{(\ell)}, T, V_{new}\right)$$

$$\mathbf{h}_m^{(\ell)} = \mathbf{g}\left(\mathbf{W}_m^{(\ell)} \mathbf{h}_{m-1}^{(\ell)} + \mathbf{b}_m^{(\ell)}\right), \quad \textbf{where} \quad \mathbf{h}_1^{(\ell)} = \textbf{vec}\left(\mathbf{X}^{(\ell)}\right) \quad \textbf{and} \quad m = 2{:}C$$

DHA: Optimization

- *rank-m* **SVD**

$$f_\ell\left(\mathbf{X}^{(\ell)};\theta^{(\ell)}\right) \overset{SVD}{=} \mathbf{\Omega}^{(\ell)}\mathbf{\Sigma}^{(\ell)}\left(\mathbf{\Psi}^{(\ell)}\right)^\top, \qquad \ell = 1{:}S$$

- ***Projection Matrix***

$$\mathbf{P}^{(\ell)} = f_\ell\left(\mathbf{X}^{(\ell)};\theta^{(\ell)}\right)\left(\left(f_\ell\left(\mathbf{X}^{(\ell)};\theta^{(\ell)}\right)\right)^\top f_\ell\left(\mathbf{X}^{(\ell)};\theta^{(\ell)}\right) + \epsilon\mathbf{I}\right)^{-1}\left(f_\ell\left(\mathbf{X}^{(\ell)};\theta^{(\ell)}\right)\right)^\top$$

$$= \mathbf{\Omega}^{(\ell)}\left(\mathbf{\Sigma}^{(\ell)}\right)^\top\left(\mathbf{\Sigma}^{(\ell)}\left(\mathbf{\Sigma}^{(\ell)}\right)^\top + \epsilon\mathbf{I}\right)^{-1}\mathbf{\Sigma}^{(\ell)}\left(\mathbf{\Omega}^{(\ell)}\right)^\top = \mathbf{\Omega}^{(\ell)}\mathbf{D}^{(\ell)}\left(\mathbf{\Omega}^{(\ell)}\mathbf{D}^{(\ell)}\right)^\top$$

where $\mathbf{D}^{(\ell)}\left(\mathbf{D}^{(\ell)}\right)^\top = \left(\mathbf{\Sigma}^{(\ell)}\right)^\top\left(\mathbf{\Sigma}^{(\ell)}\left(\mathbf{\Sigma}^{(\ell)}\right)^\top + \epsilon\mathbf{I}\right)^{-1}\mathbf{\Sigma}^{(\ell)}.$

- **Sum of *Projection Matrices***

$$\mathbf{A} = \sum_{i=1}^{S}\mathbf{P}^{(i)} = \widetilde{\mathbf{A}}\,\widetilde{\mathbf{A}}^\top, \quad \textbf{where} \quad \widetilde{\mathbf{A}} \in \mathbb{R}^{T\times mS} = \left[\mathbf{\Omega}^{(1)}\mathbf{D}^{(1)}\ldots\mathbf{\Omega}^{(S)}\mathbf{D}^{(S)}\right].$$

Cholesky Decomposition

DHA: Optimization

- ***Objective Function can be reformulated as follows:***

$$\min_{\mathbf{G},\mathbf{R}^{(i)},\theta^{(i)}} \sum_{i=1}^{S} \left\| \mathbf{G} - f_i\left(\mathbf{X}^{(i)};\theta^{(i)}\right)\mathbf{R}^{(i)} \right\| \equiv \max_{\mathbf{G}} \left(\mathbf{tr}\left(\mathbf{G}^\top \mathbf{A}\mathbf{G}\right) \right).$$

- ***So, we have:***

$$\mathbf{AG} = \mathbf{G\Lambda}, \textbf{ where } \Lambda = \left\{\lambda_1 \ldots \lambda_T\right\}$$

$$\widetilde{\mathbf{A}} = \mathbf{G}\widetilde{\mathbf{\Sigma}}\widetilde{\mathbf{\Psi}}^\top \longrightarrow \text{Incremental PCA}$$

- ***DHA mappings can be calculated as follows:***

$$\mathbf{R}^{(\ell)} = \left(\left(f_\ell\left(\mathbf{X}^{(\ell)};\theta^{(\ell)}\right) \right)^\top f_\ell\left(\mathbf{X}^{(\ell)};\theta^{(\ell)}\right) + \epsilon \mathbf{I} \right)^{-1} \left(f_\ell\left(\mathbf{X}^{(\ell)};\theta^{(\ell)}\right) \right)^\top \mathbf{G}.$$

DHA: Optimization

- ***In order to use back-propagation algorithm for seeking an optimized parameters for the deep network, we also have:***

$$\frac{\partial \mathbf{Z}}{\partial f_\ell\left(\mathbf{X}^{(\ell)};\theta^{(\ell)}\right)} = 2\mathbf{R}^{(\ell)}\mathbf{G}^\top - 2\mathbf{R}^{(\ell)}\left(\mathbf{R}^{(\ell)}\right)^\top\left(f_\ell\left(\mathbf{X}^{(\ell)};\theta^{(\ell)}\right)\right)^\top.$$

where

$$\mathbf{Z} = \sum_{\ell=1}^{T} \lambda_\ell$$

Datasets

Table S2: The datasets.

Title	ID	S	K	T	V	X	Y	Z	Scanner	TR	TE
Mixed-gambles task	DS005	48	2	240	450	53	63	52	S 3T	2	30
Visual Object Recognition	DS105	71	8	121	1963	79	95	79	G 3T	2.5	30
Word and Object Processing	DS107	98	4	164	932	53	63	52	S 3T	2	28
Auditory and Visual Oddball	DS116	102	2	170	2532	53	63	40	P 3T	2	25
Multi-subject, multi-modal	DS117	171	2	210	524	64	61	33	S 3T	2	30
Forrest Gump	DS113	20	10	451	2400	160	160	36	S 7T	2.3	22
Raiders of the Lost Ark	N/A	10	7	924	980	78	78	54	S 3T	3	30

S is the number of subject; K denotes the number of stimulus categories; T is the number of scans in unites of TRs (Time of Repetition); V denotes the number of voxels in ROI; X, Y, Z are the size of 3D images; Scanners include S=Siemens, G = General Electric, and P = Philips in 3 Tesla or 7 Tesla; TR is Time of Repetition in millisecond; TE denotes Echo Time in second; Please see *openfmri.org* for more information.

Simple Tasks Analysis

Future Works

- This paper extended a deep approach for hyperalignment methods in order to provide accurate functional alignment in multi-subject fMRI analysis.

- Deep Hyperalignment (DHA) can handle fMRI datasets with nonlinearity, high-dimensionality (broad ROI), and a large number of subjects. Further, its time complexity fairly scales with data size and the training data is not referenced when DHA computes the functional alignment for a new subject.

- In the future, we will plan to employ DHA for improving the performance of other techniques in fMRI analysis, e.g. Representational Similarity Analysis (RSA).

Thank You!
